Sprecher CA, Novak JE,

Novel soluble receptor polypeptides and polynucleotides used as cytokine antagonist for stimulating ligand activity-induced proliferation of hematopoietic cells and for suppressing immune response in a mammal.

Claim 29; Page 175-176; 243pp; English

The invention relates to an isolated soluble ralphall cytokine receptor polypopide and their colM molecules ralpha proteins are useful for inhibiting or antagonising the ligand activity-induced proliferation of haematopoletic cells and haematopoletic cell progenitors preferably lymphoid cells which are natural killer cells or cytokoxic Tesls. Tapha is useful for treating immune and inflammatory disputers; for reducing proliferation of neoplastic B or T cells, for suppressing an

immune response in a mammal exposed to an antigen or pathogen. Zalpha is useful for treating diseases that require immune regulation including autoimmune diseases such as rheumatoid arthritis, multiple sclerosis, myasthenia gravis, systemic lupus erythematosus (SLE) and diabetes; asthma, ulcerative colitis, inflammatory bowel disease, Crohn's disease, sepsis, viral infection (dengue virus infection) and cancer. The present sequence is human soluble IL-Rgamma cytokine receptor CDNA fragment
                                                                                                                                                                                                                                                            9

```

The invention relates to an interleukin 2 (IL-2) common gamma chain (ogammac) or its mutein, variant, fusion protein, functional derivative, circularly permutated derivative or fragment. Specific antibodies and

```
small molecules capable of modulating the interaction between IL-2 cgammac and nuclear factor kB inducing kinase (NIK) are useful for the manufacture of a medicament for the treatment of a disease, e.g. a disease resulting from excessive immune response such as rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, asthma, cardiac infarct, Alzheimer's disease or atherosclerosis; or an autoimmune disease, such as immune thyroiditis, or other arthropaties, e.g. autoimmune haemolytic anemia. The small molecule is useful for modulating signaling through cgammac. The present sequence represents an IL-2 cgammac protein

The human IL-2 receptor gamma chain preform (AAR47148), including the signal peptide, is encoded by the sequence given in AAQ54828. The mature protein (AAR47149) is encoded by sequence AAQ548319, while a soluble form of IL-2 receptor gamma chain (AAR47150) is encoded by AAQ548310, while a soluble form suitable for expression in prokaryotes (AAR47151) is encoded by AAQ548310. Primers 1-6 (AAQ54820-25) are based on the N- terminal sequence of IL-2 receptor gamma chain, and are used to isolate IL2 receptor gamma chain, and are used to isolate IL2 receptor gamma given in AAR47151. (Updated on 25-MAR-2003 to correct PN field.)

New interleukin-2 common gamma chain or its mutein, variant, fusion protein, functional derivative, circularly permutated derivative or fragment useful for treating Alzheimer's disease or atherosclerosis.

Page 96-97; Opp; English Claim 5;

(ggammac) or its mutein, variant, function protein, functional derivative, circularly permutated derivative or fragment. Specific antibodies and carcularly permutated derivative or fragment. Specific antibodies and cgammal molecules capable of modulating the interaction between IL-2 cyammac and nuclear factor kB inducing kinase (NIK) are useful for the manufacture of a medicament for the treatment of a disease, e.g. a disease resulting from excessive immune response such as rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, asthma, cardiac such as immune thyroiditis, or ther arthropaties; e.g. autoimmune disease haemolytic anemia. The small nolecule is useful for modulating signaling through cgammac. The present sequence represents an IL-2 cgammac protein 120 142 180 202 9 82 23 INTTILIPNGNEDITADFFLITMPIDSLSVSTLPLPEVQCFVFNVEYMNCTWNSSSEPQP TNLTLHYWYKNSDNDKVQKCSHYLFSEEITSGCQLQKKEIHLYQTFVVQLQDPREPRRQA 121 TOMLKLONLVIPWAPENLTLHKLSESQLELNWNNRFLNHCLEHLVQYRTDWDHSWTEQSV 143 TOMIKLONIVIPWAPENLILIKILSESQLEINWNNRFINHCLEHIVOYRIDMDHSWTEQSV 1 INTTILTPNGNEDITADFFLTTMPTDSLSVSTLPLPEVQCFVFNVEYMNCTWNSSSEPQP ô Length 357; Indels 100.0%; Score 1288; DB 7; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    143 TOMIKLONLVIPWAPENLILHKLSESQLELNWNNRFLNHCLEHLVQYRTDWDHSWTEQSV 202
                                                                                                                                                                                                    The invention relates to an isolated soluble zalphall cytokine receptor polypeptide and their cDNA molecules. Zalpha proteins are useful for inhibiting or antagonising the ligand activity-induced proliferation of haematopoletic cells and haematopoletic cells progenitors preferably lymphoid cells which are natural killer cells or cytotoxic T cells. Is useful for treating immune and inflammatory disorders, for reducing proliferation of neoplastic B or T cells, for suppressing an immune response in a mammal exposed to an antigen or pathogen. Zalpha is useful for treating diseases that require immune regulation including autoimmune diseases such as rheumatoid arthritis, multiple solerosis, myasthenia gravis, systemic lupus erythematosus (SLB) and diabetes; sethum, ulcerative colitis, inflammatory bowel disease. Crohn's disease, sepsis, viral infection (dengue virus infection) and cancer. The present sequence is human soluble IL-2Rgamma/kappa light chain fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    82

The human IL-2 receptor gamma chain preform (AAR47148), including the signal peptide, is encoded by the sequence given in AAG54828. The mature protein (AAR47149) is encoded by sequence AAG54829. A soluble form of IL-2 receptor gamma chain (AAR47150) is encoded by AAG54830, while a soluble form suitable for expression in prokaryotes (AAR47151) is encoded by AAG54831. Primers 1-6 (AAG54820-25) are based on the N- terminal sequence of IL-2 receptor gamma chain, and are used to isolate IL2 receptor gamma chain, and are used to obtain the protein given in AAR47151. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

This invention relates to a novel isolated human Jak3 variant polynucleotides. The Jak3 or gamma c polypeptides, muteins, fragments, polynucleotides to them are useful For in vitro or in vivo screening or treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions and severe infections due to reduced levels of T and natural killer (IMK) cells, as well as hypogammaglobulinaemia. The kinases suggests the possibility of biological activities beyond the Severe Combined Immunodeficiencies described patients with specific mutations in either the gamma c subunit of a cytckine receptor (e.g., IL-4, IL-7, IL-9, and IL-15) or in the Janus kinase. In particular, modulation of Jak kinase activities should be useful in situations where the Jak kinase activities should be useful in situations where the Jak kinase activities should be useful in situations where the Jak kinase activities should be useful in situations where the Jak kinase activities should be useful in situations where the Jak kinase activities should be useful in situations where the Jak kinase thuctions have been implicated, e.g., lymphoid cell degeneration, and atrophy of responsive cell types: For example, and strophy of responsive cell types: The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              83 INLILHYWYKNSDNDKVQKCSHYLFSEEITSGCQLQKKEIHLYQTFVVQLQDPREPRRQA 142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TOMLKLONLVI PWAPENLTLHKLSESQLELNWNNRFLNHCLEHLVQYRTDWDHSWTEQSV 180

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease, inhibitor, transporter, cytosketatal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to polypeptide, is useful for treating cancer. The polypeptide is also polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed polymenides are particularly useful for treating or preventing myelona, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, imphona or leukaemia. These are also useful for greening agents for treating the above mentioned diseases. This sequence represents an expensed protein tag (RFT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed profiling. When the published byte sequences to appear in the printed profiling. Note: This sequences are also appear in the printed profiling. Note: This sequences does not appear in the printed profiling. Note: This sequences are also appear in the printed profiling. Note: This sequences are also appear in the printed profiling. ```
The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic composition for eliciting in a mammal an immunogenic composition for eliciting in a colypeptide. The purified polypeptide, or the antibody that binds to this polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide is useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptide and class I or class II MHC-binding polypeptide. The polypeptides and class I or leukamia. These are also useful for reating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, asrcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence fores represents an texting the above mentioned diseases. This sequence fore represents an profiling. Note: This sequence does not appear in the printed profilation but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                      Translational profiling, expressed protein tag; EPT; kinase; phosphatase; protease inhibitor; transporter; cytoskeletal protein; reseptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.

Transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide is useful for tracting oracer. The polypeptide is useful for tracting cancer. The polypeptide is also useful for tracting cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         202
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Translational profiling, expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; reseptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.
class I or class II MHC-binding polypeptide. The polypeptides and polynuclectides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor our transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I will make binds to a naturally processed polymolectides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, machanic myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Translational profiling, expressed protein tag, EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide is useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, reating or preventing englowed protein tages. This sequence represents an treating the above mentioned diseases. This sequence represents for treating the above mentioned diseases. This sequence represents an profiling. Note: This sequence does not appear in the printed profiling to but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 TNLTLHYWYKNSDNDKVQKCSHYLFSEEITSGCQLQKKEIHLYQTFVVQLQDPREPRRQA 120

This sequence shows fusion polypeptide 603, which is capable of binding cytokine IL-4 to form a non-functional complex. The invention concerns production of antagonists to any cytokine that utilizes an alpha production of antagonists to any cytokine that utilizes an alpha pecificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component causing beta-receptor dimerization, the soluble alpha specificity determining component of the receptor (sR alpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form heterodimers (sR-alpha:beta-1) that act as antagonist to the cytokine by binding the cytokien to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (dillary ineurotrophic factor) family of cytokines. The invention provides the basis for the development of IL-6 antagonists, as they show that if, in the presence of a ligand, a non-functional intermediate complex, considering of the ligand, it will effectively block the action of the ligand. Effective antagonists of little considering expensive and its beta-1 receptor component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    specificity determining components of their receptors and the extracellular domain of gpi30. The resultant heterodimers, function as high-affinity traps, rendering the cytokine inaccessbile to form a signal transducing complex with the native membrane-bound forms of their receptor. The nucleic acids and polypeptides are useful for treating cytokine-related diseases or disorders section as esteoporosis and primary and secondary effects of cancer including multiple myeloms or cachexia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acid molecule for treating cytokine-related diseases or disorders encodes a fusion polypeptide capable of binding a cytokine to form a nonfunctional complex.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor. transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in ammanda an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to polypeptide, is useful for treating cancer. The polypeptide is also useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to ancurately processed class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (EPT) isolated from human tissue for translational spocifiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TNLTLHYWYKNSDNDKVQKCSHYLPSEEITSGCQLQKKEIHLYQTFVVQLQDPREPRRQA 120

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New human cytokine, designated zalphall ligand, useful for stimulating the proliferation and/or development of hematopoletic cells in vitro and in vivo, and for treating tumorigenesis.

Disclosure; Page 205-206; 256pp; English.

The present sequence represents a human zalphall ligand polypeptide, which is a cytokine. The zalphall ligand is useful for stimulating the proliferation and development of hematopoletic cells in vitro and in vivo. Zalphall ligand polynucleotides can be used as primers or probes for cloning the zalphall igene. The zalphall ligand is useful for treating trumourigenesis. A zalphall ligand-saporin fusion toxin may be used for treating leukaemiss and lymphomas. Antagonists against zalphall ligand are useful as research reagents for characterizing ligand-receptor interaction. Antagonists are also useful for inhibiting expansion,

                                                                                                                                                                                                                                  9
proliferation, activation and differentiation of cells involved in regulating hematopoiesis. The zalphall ligand may also be used to stimmlate an immune response against B cell tumour, a virus, a parasite or a bacterium. The zalphall polypeptides, polynucleotides, antagonists, agonists and antibodies are also useful for the detection, diagnosis, prevention, and treatment of diseases associated with a zalphall ligand

```
The invention relates to an isolated soluble zalphall cytokine receptor polypeptide and their cDNA molecules. Zalpha proteins are useful for inhibiting or antagonialing the ligand activity-induced proliferation of haematopoietic cells and haematopoietic cell progenitors preferably completed cells which are natural killer cells or cytocoxic T cells. Zalpha is useful for treating immune and inflammatory disorders, for reading proliferation of neoplastic B or T cells, for suppressing an immune response in a mammal exposed to an antigen or pathogen. Zalpha is useful for treating diseases that require immune regulation including autoimmune diseases such as rheumatoid arthritis, multiple solerosis, myasthenia gravis, systemic lupus erythematosus (SIE) and diabetes; sething understive collisis, inflammatory bowel disease, Crohn's disease, sepsis, viral infection (dengue virus infection) and cancer. The present sequence is human soluble Zalphail cytokine receptor ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

The present invention relates to the isolation of a novel cytokine, calphall Ligand and the polynucleotide encoding it. The invention also gives the sequence for the zalphall inceptor and the polynucleotide encoding it. The zalphall Ligand polypeptide stimulates proliferation of natural killer (NK) cells or NK cells progenitors, the activation of NK cells, proliferation of Teclls, proliferation of Secolls stimulated with anti-CD40 antibodies, stimulates an antiganic response in a mammal, and reduces proliferation of B-cells stimulated with anti-CD40 antibodies the calphall Ligand polypeptide is also useful in preparing antibodies the bind to zalphall Ligand polypeptide is also useful in preparing antibodies that bind to zalphall Ligand polypeptide is also useful in preparing antibodies that be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents human zalphall Ligand polypeptide. The cDNA encoding this is isolated trom a cDNA library from activated human peripheral blood cells (BPECS) Sequence 162 AA;

Disclosure, Page 37, 176pp, English

The invention relates to a novel method for treating or preventing an arthritic disorder in a subject. The method involves administering to the arthritic disorder in a subject. The method involves administering to the subject an interleukin-21 (IL-21)/IL-21 Respect (IL-2R) antagonist context of an infectious disorder, in a subject, by administering IL-21/IL-21R agonist, to increase immune cell activity. The action of the invention has antirheumatic, antiarthritic, osteopathic, method of the invention has antirheumatic, antiplarasitic, immunosuppressive, antidiabetic neuroprotective, dermatological, antidiabetic neuroprotective, dermatological, antidiabetic neuroprotective, dermatological, antituloer, antisathmatic, antidiabetic neuroprotective, dermatological, antidiabetic neuroprotective, dermatological, antidiabetic neuroprotective, dermatological, antidiabetic neuroprotective, dermatological, cartifitis, juvenile rheumatory activity. The method of a useful for arthritis or ankylosing spondylitis, and also cancer such as rheumatoid arthritis, osteoritic arthritis, juvenile rheumatoid arthritis, osteorituin and antigen to preferably human. A method of the invention is also useful for increasing the ability of a vaccine composition containing an antigen to elicit a protective immune response in a subject against the antigen to from cancer or tumour cell antigen or expressed on the marker of gancer coll antigen nor expressed on the marker or prevent a curious of immune or hematogonistic cells and thus to reprevent a context of immune of membrase and a such as arrived or prevent and antigen or immune or hematogonistic cells and thus to reprevent antigen of immune or hematogonistic cells and thus to reprevent antigen or membrase for any antigen and antige diabetes mellitus, multiple sclerosis, myasthenia gravis, systemic lupus erythematosus, dermatitis, ulcer, asthma, allergic asthma, anaemia, hepatitis, Graves's disease, graft versus host disease, and scleroderma. The present sequence is used in an exemplification of the invention immune disorders, such as autoimmune diseases,

New IL-21 polypeptide and encoding polynucleotide, useful for diagnosing and treating disorders with aberrant expression or activity of the IL-21 polypeptide, such as cancer, rheumatoid arthritis, multiple sclerosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to polynucleotides and polypeptides of interleuki 21 (II-21) antagonists, that bind with specificity and exhibit an EC50 that is not detectable in receptor binding studies. The antagonists of the invention have mutations in the D helix of the IL-21 molecule, and can be used to o inhibit the activity of IL-21 with its cognate receptor. The IL-21 antagonists are useful for diagnosing and treating disorders involving the aberrant expression or activity of the IL-21 polypeptide,
                                                                                                                                                                autoimmune disorder; rheumatoid arthritis; multiple sclerosis; systemic lupus erythematosus; myasthenia gravis; diabetes; human; zalphall ligand.

interleukin-

```
The invention describes a fusion polypeptide comprising at least a fragment of a MU-1 polypeptide and a non-MU-1 fusion polypeptide. The polypeptide is useful in regulating haematopoises (e.g. in cases of anaemias) and/or immune responses (e.g. immune response to cancer, infections or to a transplanted organ) and in identifying other members of the haematopoistin superfamily, including otherines and receptors. The polymucleotide may be used to express recombinant protein for analysis, characterisation or therapeutic use; and as markers for tissues or chromosomes. The polypeptide and polymucleotide may also be used as nutritional sources or supplements. This is the amino acid sequence of human interleukin 21 (IL21), a cytokine receptor that can be used to characterise the novel haematopoietin receptor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

residues at positions 114 and 119 of the mature polypeptide are both replaced by Asp. The mutant IL-21 polypeptides inhibit or suppress T-cell activation. They preferably comprise a sequence that increases circulating half-life, such as the Fc region of an IgG molecule and may proliferation in response to either anti-CD3 monoclonal antibodies or proliferation in response to either anti-CD3 monoclonal antibodies or IL-21. A claimed method of suppressing the immune response in a patient comprises administering the IL-21 antegonist or ancieto acid encoding it. The method is used to treat an autoimmune disease such as rheumatic cliease, including systemic lupus erythematosus, Sjogran's syndrome, selectoderma, mixed connective tissue disease, dermatomyositis, polymyositis, Reiter's syndrome, or Behcet's disease, or rheumatoid surhritis, type I diabetes, autoimmune disease, or rheumatoid surhritis, type I diabetes, autoimmune disease of the central nervous system such as multiple sclerosis, myasthenia gravis, or encephalomyelitis, or an autoimmune disease elected from pemphigus vegetans, pemphigus foliaceus, Senear-Usher syndrome, selectal in pemphigus vegetans, pemphigus for inflammatory bowel disease (all

The invention relates to polynucleotides and polypeptides of interleukin-
[11-21] antagonists, that bind with specificity and exhibit an BC50
[11-21] antagonists, that bind with specificity and exhibit an BC50
[11-21] antagonists in receptor binding studies. The antagonists of
[11-21] antagonists are useful for diagnoshing and treating disorders
[11-21] antagonists are useful for diagnoshing and treating disorders
[11-21] antagonists are useful for diagnoshing and treating disorders
[11-21] antagonists are useful for adagnoshing and treating disorders
[11-21] antagonists are useful for adagnoshing and treating disorders
[11-21] polypeptides
[11-21] polypeptides
[11-21] antagonist and diabetes. The polypeptides or polypeptides
[11-21] antagonist and diabetes. The polypeptides or polypeptides
[11-21] antagonist and diabetes are tracet tissues. The present sequence
[11-21] antagonist. The antagonist molecule is a mutant of IL-21
[11-21] polypeptide, with Gln145Asp and Ile148Asp substitutions. The resulting
[11-21] mutant was designated zalphall ligand Q153D/II56D
                                                                                                                                              New IL-21 polypeptide and encoding polynuclectide, useful for diagnosing and treating disorders with aberrant expression or activity of the IL-21 polypeptide, such as cancer, rheumatoid arthritis, multiple sclerosis and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LPAPEDVETNCEWSAFSCFQKAQLKSANTGNNERIINVSIKKLKRKPPSTNAGRRQKHRL

The invention relates to polynucleotides and polypeptides of interleuking that integonists, that bind with specificity and exhibit an EC50 that is not detectable in receptor binding studies. The antagonists of the invention have mutations in the D halix of the IL-21 molecule, and can be used to inhibit the activity of IL-21 with its cognate receptor. The invention have mutations in the D halix of the IL-21 molecule, and can be used to inhibit the activity of IL-21 with its cognate receptor. The IL-21 antagonists are useful for diagnosing and treating disorders involving the aberrant expression or activity of the IL-21 polypeptide, such as cancer, inflammatory and autoimmume disorders, including the under the pression of a systemic lugus erythematosus, mysthenia gravis and diabetes. The polypeptides can also be used to prepare antibodies that bind IL-21 epitopes, peptides or polypeptides, and for enhancing in vivo killing of target tissues. The present sequence is human IL-21 antagonist. The antagonist molecule is a mutant of IL-21 polypeptide, with truncation after residue 147 (Met) and GIL-21 polypeptide, with truncation after residue 147 (Met) and GIL-21 polypeptide.
                                                                                                                                                                                                                                                                      New IL-21 polypeptide and encoding polynucleotide, useful for diagnosing and treating disorders with aberrant expression or activity of the IL-21 polypeptide, such as cancer, rheumatoid arthritis; multiple sclerosis and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 LPAPEDVETNCEWSAFSCFQKAQLKSANTGNNERIINVSIKKLKRKPPSTNAGRRQKHRL 120

The present sequence represents a MBP-human zalphall ligand fusion in the plasmid pTAP126. Zalphall ligand is a cytokine. The zalphall ligand is useful for stimulating the proliferation and development of haseful for stimulating the proliferation and development of hasematopoietic cells in vitro and in vivo. Zalphall ligand polymucleotides can be used as primers or probes for cloning the zalphall appears in the zalphall ligand is useful for treating tumourispensis. A zalphall ligand-saporin fusion toxin may be used for treating leukaemias and lymphomas. Antagonists against zalphall ligand are useful as research reagents for characterizing ligand-receptor interaction. Antagonists are also useful for inhibiting expansion, proliferation, activation and differentiation of cells involved in regulating hematopoissis. The zalphall ligand may also be used to stimulate an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      QLKSANTGNNERIINVSIKKLKRKPPSTNAGRRQKHRLTCPSCDSYEKKPPKEFLERFKS 142

The present invention relates to the isolation of a novel cytokine, albhali Ligand and the polymucleotide encoding it. The invention also gives the sequence for the zalphali receptor and the polymucleotide encoding it. The zalphali receptor and the polymucleotide encoding it. The zalphali Ligand polypeptide stimulates proliferation of natural killer (WK) cells or NK cell progenitors, the activation of NK cells, proliferation of B-cells or NK cells proliferation of B-cells simulated with anti-Co40 antibodies, stimulates an antigenic response in a mammal, and reduces proliferation of B-cells stimulated with anti-fod antibodies. The bind to zalphali Ligand epitopes. The zalphali Ligand polypucleotides can be used as probes or primers to clone regions of a zalphali Ligand gene, and in gene therapy. Zalphali Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      440 OLKSANTGNNERIINVSIKKLKRKPPSTNAGRROKHRLTCPSCDSYEKKPPKEFLERFKS 499
                                                                                                                                                                                                                                                                                                                                                                                                                                       New zalphall ligand polypeptides and polymucleotides, useful for
stimulating proliferation, activation, differentiation and/or induction
of inhibition of specialized cell function, or for stimulating an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a mouse zalphall ligand polypeptide, which is a cytokine. The zalphall ligand is useful for stimulating the proliferation and development of haematopoletic cells in vitro and in vivo. Zalphall ligand polymucleotides can be used as primers or probes for cloning the zalphall ligand saporin fuach croxin may be used for treating leukaemias and lymphomas. Antagonists against zalphall ligand to reacting leukaemias and lymphomas. Antagonists against zalphall ligand are useful as research reagents for characterizing ligand-receptor interaction. Antagonists for inhibiting expansion, proliferation, activation and differentiation of cells involved in regulating hematopoiesis. The zalphall ligand may also be used to stimulate an immune response against B cell tumour, a virus, a parasite con a bacterium. The zalphall polypeptides, polynucleotides, antagonists, agonists and antibodies are also useful for the detection, diagnosis, contention, and treatment of diseases associated with a zalphall ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human cytokine, designated zalphall ligand, useful for stimulating the proliferation and/or development of hematopoietic cells in vitro and in vivo, and for treating tumorigenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MERTLVCLVVIFLGTVAHKSSPQGPDRLLIRLRHLIDIVEQLKIYENDLDPELLSAPQDV

The invention relates to an isolated soluble zalphall cytokine receptor polypeptide and their CDNA molecules. Zalpha proteins are useful for inhibiting or antagonising the ligand activity-induced proliferation of haematopoietic cells and haematopoietic cell progenitors preferably impublic cells which are natural killer cells or cytotoxic T cells. Zalpha is useful for treating immune and inflammatory disorders, for reducing proliferation of neoplastic Borr cells, for suppressing an immune response in a mammal exposed to an antigen or pathogen. Zalpha is useful for treating diseases that require immune regulation including autoimmune diseases such as rheumatoid arthritis multiple sclerosis; mysthenia gravis, systemic lupus expthematosis (GLB) and diabetes, asthma, ulcerative colitis, inflammatory bowel disease, Crohn's disease, sepsis, viral infection (dengue virus infection) and cancer The present

The present invention relates to the isolation of a novel cytokine, calphall Ligand and the polymucleotide encoding it. The invention also gives the sequence for the Zalphall Enceptor and the polymucleotide encoding it. The zalphall Ligand polypeptide stimulates proliferation of matural killer (NK) cells or NK cell progenitors, the activation of NK cells, proliferation of T-cells, proliferation of T-cells, proliferation of T-cells stimulated with anti-CD40 antibodies, stimulates an antigenic response in a mammal, and reduces proliferation of B-cells stimulated with anti-IgM antibodies. The zalphall Ligand polymorphale is also useful in preparing antibodies that bind to zalphall Ligand epitopes. The zalphall Ligand polymucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify antibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents New zalphall ligand polypeptides and polynucleotides, useful for stimulating proliferation, activation, differentiation and/or induction of inhibition of specialized cell function, or for stimulating an antigenic response. 0; Gaps 57.2%; Score 486; DB 5; Length 146; 63.0%; Pred. The present sequence is the protein sequence of murine interleukin-21 (IL 21). The invention provides antagonists of the IL-21 receptor. These include mutants of murine IL-21 in which the GIL residues at position 119 of the mature polypeptide is substituted by Asp ADS8500 or in which the GIL residues at position 114 and 119 of the mature polypeptide are both compared by Asp ADS8507. The mutant IL-21 polypeptides inhibit or suppress T-cell activation. They preferably comprise a sequence that increases circulating half-life, such as the Fc region of an IgG molecule increases circulating half-life, such as the Fc region of an IgG molecule call ary proliferation in response to either anti-CD3 monoclonal call and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full and full 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New substantially pure interleukin-21 polypeptide, useful for diagnosing, treating and prognosticating autoimmune disorders, e.g. rheumatic disease, type I diabetes, Graves disease, multiple sclerosis, psoriasis and myasthenia gravis.
                                                                                                                                                                                                                                                                      antiarthritic
